Articles

A Fluorescent Lipid Analogue Can Be Used to Monitor Secretory Activity and for Isolation of Mammalian Secretion Mutants
N.T. Kitstakis, C.-Y. Kao, R.-H. Wang, and M.G. Roth ................................................................. 135–150

Mapping In Vivo Associations of Cytoplasmic Proteins with Integrin β1 Cytoplasmic Domain Mutants
J.M. Lewis and M.A. Schwartz ................................................................. 151–160

Molecular Cloning and Characterization of Human Kinectin
A. Füttener, G. Krupp, B. Krämer, H. Lenke, and M. Krönke .................................................. 161–170

Characterization of Kinectin, a Kinesin-binding Protein: Primary Sequence and N-Terminal Topogenic Signal Analysis
H. Yu, C.V. Nicchitta, J. Kumar, M. Becker, I. Toyoshima, and M.P. Sheetz ........................................ 171–183

The Cyclosome, a Large Complex Containing Cyclin-Selective Ubiquitin Ligase Activity, Targets Cyclins for Destruction at the End of Mitosis

Control of the Cdc2/Cyclin B Complex in Xenopus Egg Extracts Arrested at a G2/M Checkpoint with DNA Synthesis Inhibitors
A. Kumagai and W.G. Dunphy ................................................................. 199–213

Phosphorylation and Activation of the Xenopus Cdc25 Phosphatase in the Absence of Cdc2 and Cdk2 Kinase Activity
T. Izumi and J.L. Maller ........................................................................ 215–226

The Bulk of Unpolymerized Actin in Xenopus Egg Extracts Is ATP-bound
J. Rosenblatt, P. Peluso, and T.J. Mitchison ................................................................. 227–236

\[ \textit{MBC: What We're About} \]

Modern biological research presents unprecedented opportunities to gather data, to understand complex cellular processes and mechanisms, and to eliminate boundaries between traditional disciplines. In turn, these opportunities add to the challenges inherent in the publication of scientific results. At \textit{Molecular Biology of the Cell}, we consider the reporting of science to be an integral part of research itself—a critical tool that properly belongs in the hands of scientists. We believe that journals should be otherwise transparent—imposing no requirements for “level of excitement,” setting no trends, enforcing no arbitrary length restrictions. Rather, \textit{MBC} seeks to facilitate communication among scientists by expecting full documentation of Methods and Results, by encouraging Introductions and Discussions that frame questions and interpret findings clearly (even for those outside an immediate circle of experts), and by advocating the interests of both contributors and readers through fair, prompt, and thorough review, coupled with responsible editorial adjudication and thoughtful suggestions for revision and clarification.

The criteria by which manuscripts are evaluated for \textit{Molecular Biology of the Cell} are straightforward: rigor in experimental design and execution, significance in the results and interpretation, and clarity and scholarship in presentation.
